Cataclysm map guide

While everyone likes to beat Apple Maps – and not without a basis – none of the existing map apps are yet good enough. Whether it be the quality of the data or the user experience, they are all too often mistaken to be acceptable, and that has to change. Apple, due to all their data aggregation, cleaning and disinfection problems, gets a few things right. The interface, both before and after iOS 7 is not only good looks, but provides a good amount of information about not only your next turn, but the turn after that. Voice directions also do a good job of informing you through long stretches of road, and advising you to stay left or bear right, so you're in the right place to turn earlier rather than too late. Unfortunately, while Apple Maps can often get you to the block you're going to, it tends to break down when it comes to the exact location and entrance to it. Google Maps is nailing data, but almost due to failure. It's less human. It will tell you you need to turn right without warning you get right, or tell you to go left when there are three left options, and only get into preparation and after a proper one in the past. (And don't think their data is great, today they told me to pull a u-turn on a dead-end road when I was actually in the middle of a 4-lane highway. This only came about after I passed the virtual impasse. On the way to the mountain view. Yes.) Nokia Here maps, TomTom, and anyone who licenses data from them all has to do a better job not only with that data, but also to provide it in a more human way. A well-tested, consistently presented place that not only tells you where to go and how to get something, but also ensures that you are in the right place to turn, and helps you get there. Like too many things, if I could somehow mix Apple and Google Maps back together, I would get something approaching what I want – great data and a great interface – but it's an option that no longer exists. For now it's a race to see what can become more like another, better, faster. Maps are hard, no doubt about it. But getting lost sucks. What is the reasonable level of accuracy? What is the reasonable level of experience? If you missed your turn, or get sent the wrong way, how often is it too often? Therapeutic targets are catalogued in 8 categories. The time from when your signal first rings, to when you finally decide to get out of bed. Time from when you sit at your desk, to when productive work begins. Time from decision-making. Slowly, your day is whittled down from all unused between moments. After all, time time Laziness, and procrastination get the better of you. The decision to recover these lost middle moments is to create rituals. Every culture on earth uses rituals to transmit information and encode behaviors that are considered important. Personal rituals can help you create a better model to handle everything from how you wake up, how you work. Unfortunately, when most people see rituals, they see meaningless prejudices. Indeed, many rituals are based on a primitive understanding of the world. But when constructing personal rituals, you encode behavior, which, in your presence, is important and cut out wasted middle moments. Program your algorithms Another way to view rituals is to see them as computer algorithms. An algorithm is a set of instructions that is repeated to get the result. Some algorithms are very effective in sorting or searching for millions of pieces of data in seconds. Other algorithms are bulky and uncomfortable taking hours to do the same task. When you form rituals, you create algorithms for your behavior. Take a delayed and painful pattern of awakening, discussing whether to sleep for another two minutes, pressing the slumber button, repeat until almost late work. It can be reprogrammed to get out of bed immediately without discussing your decision. How to form a ritual I myself formed personal rituals, how to manage e-mail, wake up every morning, write articles and read books. Far from making me inflexible, these rituals give me a useful default model that works best 99% of the time. When my current ritual doesn't work, I can always stop using it. The formation of a ritual is not too complicated, and the same principles of changing habits are applied: write your sequence of behaviors. I suggest starting with a simple ritual, which is no more than 3-4 steps. Before you try to add new actions, wait until you settle the ritual. Commit to sticking to your ritual for thirty days. This step will be an idea and condition it into your nervous system as a habit. Define a clear trigger. When does your ritual begin? The ritual to wake up is easy - the sound of your alarm will work. What triggers you to go to the gym, read a book, or reply to an email — you'll have to decide. Tweak the pattern. Your algorithm probably won't be fully effective for the first time. Making a few tweaks after the first 30 days of testing can make your ritual more useful. Ways to use the ritual Based on the ideas mentioned above, here are some ways you can implement your rituals: 1. Awakening Set the morning ritual when you wake up, and other few things you do immediately afterwards. To combat grogginess after waking up immediately, my solution is to make a few pushups immediately after getting out of bed. After that I sneak ninety minutes of reading before getting ready for morning classes. 2. Using the Web How often email, you look at Google Reader or check Facebook every day? I found taking all my daily internet needs and compression compression in one, a very effective ritual, I was able to break 75% of my internet time without losing any communication. 3. Reading How long do you get to read books? If your library isn't as large as you'd like, you might want to consider the rituals you use to read. Programming a few steps lead yourself to read rather than watching TV or during a break your day can chew through dozens of books each year. 4. Friendship rituals can also help you communicate. Set up a conversation start ritual when you have opportunities to meet people. 5. Working one of the most difficult obstacles to overcoming delays is the creation of a concentrated flow. Creating these steps into a ritual can allow you to start working quickly or continue working after a break. 6. Going to the gym If exercise is a struggle, ritual coding can eliminate many difficulties. Set a quick ritual for using immediately after work or waking up. 7. Exercise Even during your workouts, you can have rituals. Intervals between runs or repetitions with a certain number of breathing can remove guesses. The ritual of performing certain exercises in a certain order can save time. 8. Sleep Form a sedative ritual in the last 30-60 minutes of your day before going to bed. This will help slow down yourself and fall asleep much easier. Especially if you plan to withdraw full energy in the morning, it will help if you eliminate insomnia. 8. Weekly Review weekly review is a big part of the GTD system. By making a simple ritual checklist for my weekly review, I can get as much of this exercise as possible in the shortest time. At first I had holistic reviews where I wrote my thoughts about the week and progress as a whole. Now I narrow my focus on specific plans, ideas and measurements. Final thoughts We all want to be productive. But the time of meeting, procrastination and laziness is sometimes the better of us. If you encounter such difficulties, do not be afraid to use these rituals to help them conquer. More tips on how to conquer Time Wasters and ProcrastinationFeatured photo credit: RODOLFO BARRETO over unsplash.com From 15,000 feet, a \$2.5 million house at 123 Highland Drive in the Queen Anne district of Seattle doesn't seem much. The roof is an undesigned gray square; yard, a small patch of unexplained space. It doesn't bother Matt Bell, a 33-year-old sales manager in the new home market. It is focused on numbers flickering at the bottom of a web browser two feet in front of it, constantly updated statistics such as average property value, county tax records, local schools, and previous sales prices. Eh, he sighs. That's \$538 per square foot, but the neighborhood average is just \$420. After choosing not to leave a comment about the house's open blog, Bell refuses to 123 Highland and zooms back through the city, neighborhood numbers disappearing to keep up with him. Forget point A to point B: maps move from simple driving directions to richly layered living landscapes, breathing information. Over the past year, more than 1,000 new map-based sites have started operating, and every 24 hours debuted from 3 to 4. The NT is throwing money at any of them that promises to transform industries such as real estate and local trade. And people are map hungry. In a Pew Institute survey last April, mobile phone users named maps the most preferred feature. (Instant messaging was secondary.) We're not just talking about better maps: Digital maps are the equivalent of milk queen Blizzard's web. They allow users to mix much earlier different data and display them, but they please, and even add their own images, videos, comments or other content. Google, Yahoo and Microsoft see all this as huge; they spend millions adding both high res satellite photography and street level images to maps. But all the frantic activity leaves one nagging question: Do these developers and corporations chart the path to profit? If you want to understand what the world of web maps can be, look at Europe, where there is a higher level of adoption of mapping technologies. In the United States, for example, commuters get traffic updates from furious helicopter pilots shouting over muddled AM radio; it's just a top-down pattern. Many European drivers use a more elegant solution. TomTom, europe's leading car navigation company, dynamically updates traffic conditions on user GPS device maps, including which roads are congested due to accidents or road works and even speed traps, with the help of subscribers. In fact, travelers form instant communities to collaborate and learn about their environment. In the United States, people are just beginning to capture the power of these communities. Traditionally, in real estate, you need to go to a county records office or police station, and pairs through dusty file cabinets, to get information that a website like Redfin.com can display in a few clicks. We want to organize information geospatially, says Redfin CEO Glenn Kelman, so that people looking for homes can capture neighborhood gestalt. For example, a home seeker might ask why a house is more expensive than others in the rest of the neighborhood, and the seller can respond by adding information on the map about recent renovations, even posting before and after photos. Such features keep the average user redfin impressive 72 minutes a week. The map is basically centerfold-it's pornographic, Kelman says. People who hang out for a long time contribute their knowledge to the local community, as well as developers and advertisers excited about the new opportunities in online search. Maps enable search, says Stephen Lawler, CEO of Microsoft MapPoint. You can actually see the real world as you understand it. Understand. recently debuted a map technology called Virtual Earth, featuring bird's-eye, 3-D photography. Groups of like-minded users can add ratings and reviews, share customized maps with others. In addition, it is testing an even more ambitious program built from thousands of street-level photos that allow visitors to maneuver through downtown Seattle and San Francisco. Both map-based search tools will offer businesses an unprecedented type of targeted advertising. Imagine the retailer will be wooing any customers panning over their location. Advertising is just one of the options being discussed in an emerging industry, a desperate revenue model. Google, Yahoo and Microsoft are currently subsidising the growth of maps. It costs Google money to pull the map, says John Musser, a blogger and software developer. Now everything is free, but it can not last forever. Targeted advertising may be the answer, but will developers and users accept it? Meanwhile, subscriptions worked in Europe, but were not usually embraced by internet users in the United States. I don't think any of us expected how the ubiquitous maps would become, admits Bret Taylor, Google Maps product manager. We launched GeoAds, a map advertising program, this April as the first effort to offset the costs of serving so many of them. The map is basically center-it's pornographic, says Glenn Kelman, CEO of real estate start-up Redfin.com.Along with questions about money, questions about control are raised. Throughout history, the guy who controlled the map was the boss, says John Metcalf, a former BRO mapmaker at Tele Atlas who is currently a consultant to Silicon Valley CL. Opening the door to all those user-contributed reviews, ratings and comments puts customers in charge. But this raises the prospect of dissatisfied sponsors and other users, because none of them can control what is being said about them. Nevertheless, the industry is currently promoting closer cooperation with its customers. After all, companies can't predict everything people want, and user-generated content gives them more sales. We really encourage users to customize their content and share their experiences, says Jocelyn Vigreux, President of TomTom USA. It's a sign of a healthy community. We don't need to control everything. Whether a user is created or not, map apps are evolving rapidly from novelty to necessity. You don't just want to find 7-Eleven, says Metcalf, you'll want to find one that carries your brand of toothpaste and it's open now. The future is our mapping.
